A Note on Programming Languages

Here's what you can use in the ACM ICPC:

- C
- C++
- Java
- Pascal

A Note on Programming Languages

Here's what you can use in the ACM ICPC:

- C
- **C++**
- **Java**
- Pascal

A Note on Programming Languages

Some useful tools:

Complete Search

Strategies to Solve

Strategies to Solve

- Keep it simple.

Strategies to Solve

- Keep it simple.
- Every problem can be solved through complete search.

Strategies to Solve

- Keep it simple.
- Every problem can be solved through complete search.
- The trick is to recognise those that would work in time.

Strategies to Solve

- Keep it simple.
- Every problem can be solved through complete search.
- The trick is to recognise those that would work in time.
- A complete search algorithm should be the first one you think about.

Strategies to Solve

- Keep it simple.

- The trick is to recognise those that would work in time.
- A complete search algorithm should be the first one you think about.
- A good rule of thumb:

Strategies to Solve

- Keep it simple.
- Every problem can be solved through complete search.
- The trick is to recognise those that would work in time.
- A complete search algorithm should be the first one you think about.
- A good rule of thumb:

If it's less than 100 million operations, it will work in time.

In how many ways can you place 8 queens on a chessboard so that they do not attack each other?

Example

Here's one way:

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

- 8 places on each row, with 8 rows for a total of 8^8 possibilities.

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

- 8 places on each row, with 8 rows for a total of 8^8 possibilities.
- Would work, but it's too slow ($8^8 = 16777216$)

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

- 8 places on each row, with 8 rows for a total of 8^8 possibilities.
- Would work, but it's too slow ($8^8 = 16777216$)

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

- 8 places on each row, with 8 rows for a total of 8^8 possibilities.
- Would work, but it's too slow ($8^8 = 16777216$)

We can do better

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

- 8 places on each row, with 8 rows for a total of 8^8 possibilities.
- Would work, but it's too slow ($8^8 = 16777216$)

We can do better - check if the current configuration isn't valid.

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

- 8 places on each row, with 8 rows for a total of 8^8 possibilities.
- Would work, but it's too slow ($8^8 = 16777216$)

We can do better - check if the current configuration isn't valid.

- At every point we have at most one queen placed on every row and column.

We could go over all possible ways to place the 8 queens, and check at the end whether it's valid.

- 8 places on each row, with 8 rows for a total of 8^8 possibilities.
- Would work, but it's too slow ($8^8 = 16777216$)

We can do better - check if the current configuration isn't valid.

- At every point we have at most one queen placed on every row and column.
- Reduces the search space to $8! = 40320$.
